

## Lecture 6: Pipelined Computations

Parallel Programming (INF-3201)  
University of Tromsø  
Autumn 2013

John Markus Bjørndalen

1

### Outline

- Pipeline technique
- Examples
  - Adding numbers
  - Sorting numbers
  - Prime number generation
  - Solving a System of Linear Equations

2

### Pipelined Computations

Problem divided into a series of tasks that have to be completed **one after the other** (the basis of sequential programming). Each task executed by a separate process or processor.

3

### Example

Add all the elements of array **a** to an accumulating sum:

```
for (i = 0; i < n; i++)
    sum = sum + a[i];
```

The loop could be “unfolded” to yield

```
sum = sum + a[0];
sum = sum + a[1];
sum = sum + a[2];
sum = sum + a[3];
sum = sum + a[4];
.
.
.
```

4

### Pipeline for an unfolded loop

5

### Another Example

**Frequency filter** - Objective to remove specific frequencies ( $f_0, f_1, f_2, f_3$ , etc.) from a digitized signal,  $f(t)$ .

Signal enters pipeline from left:

6

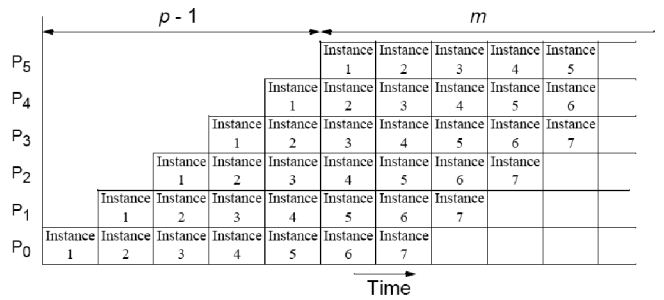

## Where can pipelining be used

Assuming problem can be divided into a series of sequential tasks, pipelined approach can provide increased execution speed under the following three types of computations:

1. If more than one instance of the complete problem is to be executed
2. If a series of data items must be processed, each requiring multiple operations
3. If information to start next process can be passed forward before process has completed all its internal operations

7

## “Type 1” Pipeline Space-Time Diagram

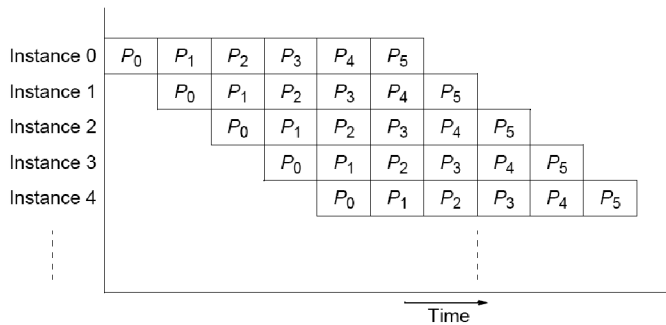

$p$  processes (or stages),  $m$  instances:

- average #cycle per instance  $t_a = (m+p-1)/m$ .  $t_a \rightarrow 1$  for large  $m$

8

## Alternative space-time diagram

9

## “Type 2” Pipeline Space-Time Diagram

Input sequence  
 $d_9 d_8 d_7 d_6 d_5 d_4 d_3 d_2 d_1 d_0 \rightarrow [P_0] \rightarrow [P_1] \rightarrow [P_2] \rightarrow [P_3] \rightarrow [P_4] \rightarrow [P_5] \rightarrow [P_6] \rightarrow [P_7] \rightarrow [P_8] \rightarrow [P_9]$

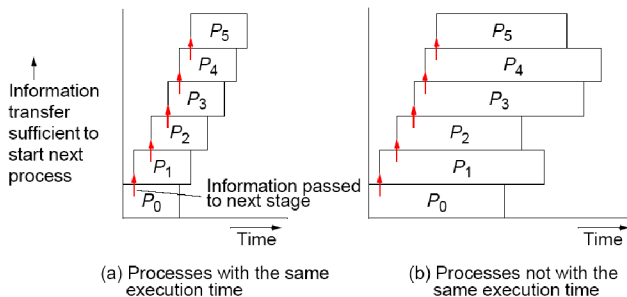

(a) Pipeline structure

(b) Timing diagram

10

## “Type 3” Pipeline Space-Time Diagram

Pipeline processing where information passes to next stage before previous state completed.

11

If the number of stages is larger than the number of processors in any pipeline, a group of stages can be assigned to each processor:

12

## Computing Platform for Pipelined Applications

### Multiprocessor system with a line configuration

13

## Outline

- Pipeline technique
- Examples
  - Adding numbers
  - Sorting numbers
  - Prime number generation
  - Solving a System of Linear Equations

14

## Pipeline Program Examples

### Adding Numbers

Type 1 pipeline computation

15

Basic code for process  $P_i$ :

```
recv(&accumulation, Pi-1);
accumulation = accumulation + number;
send(&accumulation, Pi+1);
```

except for the first process,  $P_0$ , which is

```
send(&number, P1);
```

and the last process,  $P_{n-1}$ , which is

```
recv(&number, Pn-2);
accumulation = accumulation + number;
```

16

## SPMD program

```
if (process > 0) {
    recv(&accumulation, Pi-1);
    accumulation = accumulation + number;
}
if (process < n-1)
    send(&accumulation, Pi+1);
```

The final result is in the **last** process.

Instead of addition, other arithmetic operations could be done.

17

## Pipelined addition numbers

### Master process and ring configuration

18

## Outline

- Pipeline technique
- Examples
  - Adding numbers
  - **Sorting numbers**
  - Prime number generation
  - Solving a System of Linear Equations

21

## Sorting Numbers

A parallel version of *insertion sort*.

22

## Pipeline for sorting using insertion sort

Type 2 pipeline computation

23

The basic algorithm for process  $P_{i \text{ is}}$

```
recv(&number, P_{i-1});
if (number > x) {
    send(&x, P_{i+1});
    x = number;
} else {
    send(&number, P_{i+1});
}
```

With  $n$  numbers, number  $P_i$  is to accept  $= n - i$ .  
 Number of passes onward  $= n - i - 1$   
 Hence, a simple loop could be used.

24

## Insertion sort with results returned to master process using **bidirectional line** configuration

25

## Insertion sort with results returned

26

## Outline

- Pipeline technique
- Examples
  - Adding numbers
  - Sorting numbers
  - Prime number generation
  - Solving a System of Linear Equations

28

## Prime Number Generation Sieve of Eratosthenes

- Series of all integers generated from 2.
- First number, 2, is prime and kept.
- All multiples of this number deleted as they cannot be prime.
- Process repeated with each remaining number.
- The algorithm removes non-primes, leaving only primes.

Type 2 pipeline computation

29

## Illustration

Algorithm steps for primes below 120

	2	3	4	5	6	7	8	9	10	Prime numbers
11	12	13	14	15	16	17	18	19	20	
21	22	23	24	25	26	27	28	29	30	
31	32	33	34	35	36	37	38	39	40	
41	42	43	44	45	46	47	48	49	50	
51	52	53	54	55	56	57	58	59	60	
61	62	63	64	65	66	67	68	69	70	
71	72	73	74	75	76	77	78	79	80	
81	82	83	84	85	86	87	88	89	90	
91	92	93	94	95	96	97	98	99	100	
101	102	103	104	105	106	107	108	109	110

30

The code for a process,  $P_i$ , could be based upon

```
recv(&x, P_{i-1});
/* repeat following for each number */
recv(&number, P_{i-1});
if ((number % x) != 0) send(&number, P_{i+1});
```

Each process will not receive the same number of numbers and is not known beforehand. Use a "terminator" message, which is sent at the end of the sequence:

```
recv(&x, P_{i-1});
for (i = 0; i < n; i++) {
    recv(&number, P_{i-1});
    if (number == terminator) break;
    if ((number % x) != 0) send(&number, P_{i+1});
}
```

31

## Outline

- Pipeline technique
- Examples
  - Adding numbers
  - Sorting numbers
  - Prime number generation
  - Solving a System of Linear Equations

32

## Solving a System of Linear Equations Upper-triangular form

$$\begin{aligned}
 a_{n-1,0}x_0 + a_{n-1,1}x_1 + a_{n-1,2}x_2 \quad \dots \quad + a_{n-1,n-1}x_{n-1} &= b_{n-1} \\
 &\vdots \\
 a_{2,0}x_0 + a_{2,1}x_1 + a_{2,2}x_2 &= b_2 \\
 a_{1,0}x_0 + a_{1,1}x_1 &= b_1 \\
 a_{0,0}x_0 &= b_0
 \end{aligned}$$

where  $a$ 's and  $b$ 's are constants and  $x$ 's are unknowns to be found.

33

## Back Substitution

First, unknown  $x_0$  is found from last equation; i.e.,

$$x_0 = \frac{b_0}{a_{0,0}}$$

Value obtained for  $x_0$  substituted into next equation to obtain  $x_1$ ; i.e.,

$$x_1 = \frac{b_1 - a_{1,0}x_0}{a_{1,1}}$$

Values obtained for  $x_1$  and  $x_0$  substituted into next equation to obtain  $x_2$ :

$$x_2 = \frac{b_2 - a_{2,0}x_0 - a_{2,1}x_1}{a_{2,2}}$$

and so on until all the unknowns are found.

34

## Pipeline Solution

First pipeline stage computes  $x_0$  and passes  $x_0$  onto the second stage, which computes  $x_1$  from  $x_0$  and passes both  $x_0$  and  $x_1$  onto the next stage, which computes  $x_2$  from  $x_0$  and  $x_1$ , and so on.

Type 3 pipeline computation

35

The  $i$ th process ( $0 < i < n$ ) receives the values  $x_0, x_1, x_2, \dots, x_{i-1}$  and computes  $x_i$  from the equation:

$$x_i = \frac{b_i - \sum_{j=0}^{i-1} a_{i,j}x_j}{a_{i,i}}$$

36

## Sequential Code

Given constants  $a_{ij}$  and  $b_k$  stored in arrays  $\mathbf{a}[\ ][\ ]$  and  $\mathbf{b}[\ ]$ , respectively, and values for unknowns to be stored in array  $\mathbf{x}[\ ]$ , sequential code could be

```
x[0] = b[0]/a[0][0]; // computed separately
for (i = 1; i < n; i++) { // for remaining unknowns
    sum = 0;
    for (j = 0; j < i; j++)
        sum = sum + a[i][j]*x[j];
    x[i] = (b[i] - sum)/a[i][i];
}
```

37

## Parallel Code

Pseudocode of process  $P_i$  ( $1 < i < n$ ) could be

```
for (j = 0; j < i; j++) {
    recv(&x[j], P_{i-1});
    send(&x[j], P_{i+1});
}
sum = 0;
for (j = 0; j < i; j++)
    sum = sum + a[i][j]*x[j];
x[i] = (b[i] - sum)/a[i][i];
send(&x[i], P_{i+1});
```

Now have additional computations to do after receiving and resending values.

38
